RESULTS

OF

OBSERVATIONS OF THE FIXED STARS

MADE WITH THE

MERIDIAN CIRCLE

AT THE

GOVERNMENT OBSERVATORY MADRAS

IN THE YEARS 1877, 1878, AND 1879

UNDER THE DIRECTION OF THE LATE

NORMAN ROBERT POGSON, C.I.E., F.R.A.S.

BY

C. MICHIE SMITH, B.Sc., F.R.A.S., F.R.S.E.

OFFICIATING GOVERNMENT ASTRONOMER AT MADRAS

VOL VI.

PUBLISHED BY ORDER OF THE GOVERNMENT OF MADRAS.

MADRAS

PRINTED AT THE LAWRENCE ASYLUM PRESS, BY G. W. TAYLOR

1893

CONTENTS

INTRODUCTION.

The present volume contains the results of the observations made with the Madras Meridian Circle in the years 1877, 1878, and 1879. The number of observations dealt with is 9,637, of which 2,744 were made in 1877, 3,416 in 1878, and 3,477 in 1879. The observers were P. Ragoonathachari (P. R), who ceased to observe in 1878 and died in 1880, Mootoosawmy Pillai (M), and P. Ragavachari (P).

The great increase in the number of observations over previous years was, unfortunately, accompanied by a decrease in the accuracy of the reductions, which has caused a large amount of extra labour in preparing the present volume for publication, and an unduly large list of errata for the years 1877 and 1878. The work was also greatly increased by the circumstance that a large proportion of the stars were observed in these years for the first time and consequently the constants, which had previously been calculated only for approximate places, had to be completely revised, the precessions being recalculated with 5-figure instead of 4-figure logarithms. As an additional check the constants were compared, when possible, with those given in other catalogues. As a consequence of this extra work the publication of the volume has been somewhat delayed.

In the first volume of the present series it is mentioned that the latitude of the Observatory is uncertain to the extent of nearly 1″ and that it was proposed to make a fresh determination of the latitude from a discussion of all the observations of circumpolar stars. This cannot be done yet, but pending the final result of such a discussion it may be well to give the following results which indicate the probable amount of the correction that will have to be applied to the N. P. Ds. given in these volumes.

1. Determination made by Mr. G. P. Lennox Conyngham R.E. of the G. T. Survey of India, by Zenith Sector observations in January 1891

$$13^\circ\ 4'\ 8''\cdot77 \pm 0''\cdot067$$

2. From approximate reduction of observation of three circumpolar stars between 1862 and 1877.

(*a*)	From 110 observations of Polaris	$13^\circ\ 4'\ 8''\cdot64$
(*b*)	... 116 ... ... 51 Cephei	$8''\cdot68$
(*c*)	... 79 ... ... R. P. L. 150	$8''\cdot68$

The assumed latitude is

$$13^\circ\ 4'\ 8''\cdot1$$

and hence it is probable that the correction to be applied to the printed observations of N. P. D. is approximately

$$-0''\cdot6$$

This determination has, of course, no claim to be considered a final one, and was, in fact, made simply for the purpose of comparing the result deducible from the circumpolar observations with the result obtained with the Zenith Sector. The large deviations of individual observations from the mean indicate, as might have been expected, that the correction for refraction is often very uncertain, especially in the observations made *sub polo*, and it seems doubtful whether a thoroughly satisfactory determination of latitude can be made by means of circumpolar stars at a place situated so near the equator as Madras is. The close agreement between the four determinations given is probably accidental and cannot be considered as a test of their accuracy.

Instrumental Corrections adopted in 1877.

Nov. 15.—Cleaned and oiled the pivots and adjusted the levelling screws. Cleaned and adjusted the microscopes.

Dec. 31.—The clock was put back one minute at 5*h*. 0*m*. S. T. and the weight on the pendulum shelf was reduced from 35 to 25 grains.

Instrumental Corrections adopted in 1879.

495.—Groombridge 1940.

517.—Comparison star for Encke's comet in 1878.

Observed with the Madras Meridian Circle in that Year.
